<b>Description</b>			
Hi,			
I tried to write a simple app, where I drag a widget from one location to another, and upon successful drop, the widget's parent gets changed to the new location.			
If the <code>setDraggable(java.lang.String mimeType)</code> is used, after dragging the widget to a location which does not accept that mime type, the dragged widget can end up in a place which should not be possible.			
If <code>setDraggable(java.lang.String mimeType, WWidget dragWidget, boolean isDragWidgetOnly)</code> version is used, everything works fine; after the invalid drag-and-drop operation the dragged widget stays properly at the original location.			
I've attached the source code (JRuby), and a screenshot of the strange behaviour. Both firefox and chrome exhibit the same behaviour.			
best,			
Gabor
