Description			
Hi,			
I am adapting cartesian charts to my needs and I hit few bugs in positioning.			
They are marked on the picture.			
attached_image			
1. mixing axis title and value label when a value is near axis placement			
1. value labels are outside the bars when using setFillRange(Chart::MinimumValueFill)			
2. mixing graph title and axis title (in my case caused by setOrientation(Horizontal) and axis(Chart::YAxis).setLocation(Chart::MinimumValue))			
3. zero tick is on the edge, tick with any other value has a small indent			
Putting the value label outside the bar can be a cure to point 1, but beware of the default white color.			
regards,			
Jan

Mixing titles appears only opera.

In FF and chrome are value labels under axis and overlapped.
