Description			
<p>Could you add a full example explaining how to display a table with a composite natural primary key in a WTreeView...</p> <p>An example based on dbo-tutorial6 (struct Coordinate) will be appreciated...</p> <p>It does not work for me even after defining Wt::Dbo::sql_value_traits</p> <p>When executed, The Sql request is looking for a field named "position" instead of retrieving "position_x" and "position_y"</p> <p>thanks for your help,</p>
