<b>Description</b>			
<p>I want to use a simple form template, that has submit button and few other hidden fields with name attribute and value attribute, to send data to another server.</p> <p>However, I can't implement the form (using either WText or WTemplate), because the name attribute is removed on client side.</p> <p>Please fix this issue.</p>

You need to use Wt::XHTMLUnsafeText as a text format for the template.

Also note that this is not going to work for plain-HTML sessions because there is already a  
that contains the entire page.

If possible, you should consider to submit the data to the other website through a server-side action (e.g. using Wt::Http::Client).

Regards,

koen
