Target version:	3.3.4		
Description			
<p>Currently a Wt session is mapped to a single browser window/tab. Opening multiple windows requires a new session to be started for each window.</p> <p>This means that information such as a users login status or shopping carts must be stored and read every page/widget load to allow an application to have multiple windows.</p> <p>Allowing multiple browser windows to use one session would make developing real world websites much easier using Wt.</p> <p>This feature has been discussed on the forums before.</p> <p>http://redmine.webtoolkit.eu/boards/1/topics/4065?r=4622</p> <p>http://redmine.webtoolkit.eu/boards/2/topics/6558?r=6614</p>
