Wt - Bug #3552

Can't get the input of a WTextArea when the user copy and paste a very long text into it

08/30/2014 04:50 PM - Anonymous

Description

Look at the sample project I attached.

There is a textarea , a submit button and a echo-back label. The user enters some text into the text area , push the submit button and my application shows the text entered into the label.

If the entered text is short , everything is ok . But , if the user copied and pasted a very long text (for example , the content of one of the "LongText*.txt" files in the source directory) , then , my application wouldn't get the text in the textarea as expected. In my system , when the text is longer than 85.6KiB , we wouldn't get the content in the textarea.

Hey,

There is a default setting () which limits the size of a POST to about 128KB. This is probably what is causing the issue.

I'm the original reporter.

I don't think it is related to the max-request-size setting. Please take a look at the wt_config.xml file in my sample project , the and are both 1280 , which I think is enough for 85.6KiB .

Hey,

did you verify in your startup messages that you're actually using your modified copy of wt_config.xml?

BR,

Wim.
