Target version:			
Description			
In the [[http://www.webtoolkit.eu/wt/doc/reference/html/classWt_1_1WLogger.html#a567c5b28fee703e37523898d30016f40 the WLogger docs]] it describes setting the logger for different scopes. It uses ``wthttp`` for example.			
I was wondering how I might define my own scopes? Or get a list of existing ones? Say for example I want all log entries related to the DB to go through a different scope than the default.

Hello Matt,

From the top of my head, the scope is just a string, so you can simply invent your own scopes. I don't know of a method that lists the scopes in use.

Best regards,

Wim.

Sounds good, but how do I log to one of these? Is there any `Wt::log("level", "scope") << msg`

?
