Description			
In libharu, it is possible to rotate text (from the examples on their git).			
When I try to apply a styleclass in the html which renders PDF, it is not rotating.			
<pre>.rotatetext { transform: matrix(-0.000, -1.000, 1.000, 0.000, 0.000, 0.000); } .rotatetext2 { transform: rotate(270deg); }</pre>			
Is it even possible to do that ?

Hey Steven,

We haven't implemented this CSS3 property in the renderer (the CSS support in the renderer is quite limited, see http://www.webtoolkit.eu/wt/doc/reference/html/classWt_1_1Render_1_1WTextRenderer.html)

It does sound like it should we should be able to do add this quite easily.

Koen

I see, thanks for the info!

kind regards
