Description			
Hi,			
I'd like to request DbO reentrant feature. It has been ignored since DbO came out but recently I've been having problems with it so I hope Wt will take this request.			
I have a recursive function to query in a hierarchical order. I have to query a ManyToMany collection in each item in the tree, however DbO throws a runtime exception. It is difficult to preload all the data into a vector as the ManyToMany implementation hides the joining table. However a custom query on the joining table can allow me to work around it.
