Target version:			
Description			
Is there a mechanism, or can a mechanism be provided in the API, during construction or during initialize() where an HTTP status code can be indicated?			
I have some code in CreateApplication for .addEntryPoint which does some basic rate limit computation.			
What is the best way to reflect this back to the client?

For the time being, I think I will perform a redirect to a WResource. This knows how to set the response code.
