

Wt - Bug #8416

Wt crashes in ~Configuration

04/27/2021 08:49 AM - Kirill Poteryaev

Description	
<p>Hello! I faced with problem using Wt. My program failed in the begin of execution. After research I realized, that problem was in http/Configuration.C:</p> <pre>Configuration::~~Configuration() { if (parentPort_ == -1) unlink(pidPath_.c_str()); }</pre> <p>pidPath_ was empty, and programm stopped after unlink function call. So I have to add a non empty string checking, like this:</p> <pre>Configuration::~~Configuration() { if (parentPort_ == -1) if (!pidPath_.empty()) // <----- unlink(pidPath_.c_str()); }</pre> <p>I am not sure it is correct, but program no more crashes. Have you ever faced with something like this?</p>

Hi,

that's odd, from the documentation it seems it should just set ENOENT flag if the path is empty. Which OS are you on? Is there some kind of error shown on the console?
