Description I would like to use BootStrap 5 I looked in example how to configure it. But NavBar is not working properly, only showing text not background and no scrollbar on long pages. If I added: <code>app->useStyleSheet("resources/themes/bootstrap/3/bootstrap-theme.min.css");</code> It's better but I know it's not the right thing to do. So, my question, how to add some theme or initialize BootStrap 5 properly? Regards,
